A d-step Approach for Distinct Squares in Strings

## Background

- In 1998 Fraenkel and Simpson showed the number of distinct squares in a string of length $n$ is bounded from above by $2 n$ and gave a lower bound asymptomatically approaching $n$ from below; for primitively rooted squares, they showed that an upper bound of $n-o(n)$ is valid for infinitely many values of $n$.
- In 2005 Ilie provided a simpler proof of Fraenkel and Simpson's main lemma and slightly improved the upper bound to $2 n-\Theta(\log n)$ in 2007.
- It is believed, that the number of distinct squares is bounded by the length of the string.

## d-step Approach

- We investigate the problem of distinct squares in relationship to the alphabet of the string.
- We construct a table whose rows are indexed by $d$ and columns are indexed by $n-d$ with entries of $\sigma_{d}(n)$.
- We conjecture that the upper bound for the maximum number of primitively rooted distinct squares is $n-d$.
- d-step approach was inspired by the techniques used for investigating the Hirsch bound for the maximum possible diameter over all $d$-dimensional polytopes with $n$ facets.

## Basic Notation

- A square is a repetition with power of 2 , distinct squares means only the types of the squares are counted, primitively rooted distinct squares means the generator itself is not a repetition.
- A run, a maximal fractional primitively rooted repetition, is formed by a maximal repetition followed by a tail.
- $\mathbf{s}(\mathbf{x})$ denotes the number of primitively rooted distinct squares in a string $x$.
- $\sigma_{\mathbf{d}}(\mathbf{n})$ denotes the maximum number of primitively rooted distinct squares over all strings of length $n$ containing exactly $d$ distinct symbols.
- A singleton refers to a symbol in a string that occurs exactly once, a pair occurs exactly twice, a triple occurs exactly three times, and in general an $k$-tuple ( $k$ times).

## Theorem 1

For all $n \geq d \geq 2, \sigma_{d}(n) \leq n-d \Longleftrightarrow \sigma_{d}(2 d)=d$ for all $d \geq 2$

| $\boldsymbol{n}-\boldsymbol{d}$ |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\boldsymbol{d}$ | $\cdots$ | $\ldots$ | $\boldsymbol{d}$ | $\cdots$ | $\ldots$ |  |
| $\ldots$ | $\cdots$ |  |  |  |  |  |
| $\cdots$ |  | $\ldots$ |  |  |  |  |
| $\boldsymbol{d}$ |  |  | $\boldsymbol{d}$ |  |  |  |
| $\ldots$ |  |  | $d$ | $\ldots$ |  |  |
| $\ldots$ |  |  | $d$ |  | $\ldots$ |  |

## Proof.

- $n<2 d$, constant under the diagonal.
- $n>2 d$, smaller or equal than the diagonal value.

## Theorem 2

## Theorem 2

For all $n \geq d \geq 2, \sigma_{d}(n) \leq n-d \Longleftrightarrow \sigma_{d}(2 d+1)-\sigma_{d}(2 d) \leq 1$ for all $d \geq 2$

| d | $\boldsymbol{n}$-d |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | ... | d-1 | d | ... | ... |
|  | ... | ... |  |  |  |  |
|  | d-1 |  | $\sigma_{d-1}(2 d-2)$ | $\sigma_{d-1}(2 d-1)$ | $\}=$ |  |
|  | d |  | $\leq 1^{2}$ | $\sigma_{d}(2 d)$ |  |  |
|  | ... |  |  |  | $\ldots$ |  |
|  | ... |  |  |  |  | $\ldots$ |

## Proof.

$d$ is the least s.t. $\sigma_{d}(2 d)>d$.
Remove the singleton, $\sigma_{d-1}(2 d-1)=\sigma_{d}(2 d)$.
$\sigma_{d}(2 d)-\sigma_{d-1}(2 d-2) \leq 1$, and
$\sigma_{d-1}(2 d-2)=d-1$. Thus
$\sigma_{d}(2 d) \leq d$.
A. Deza, F. Franek and M. Jiang

A d-step Approach for Distinct Squares in Strings

## Theorem 3

## Theorem 3

For all $d \geq 2$, if $\sigma_{d}(2 d+1) \leq d$, then
(1) $\sigma_{d}(n) \leq n-d$ for all $n \geq d \geq 2$
(2) $\sigma_{d}(n) \leq n-d-1$ for all $n>2 d \geq 4$

| $\boldsymbol{n}-\boldsymbol{d}$ |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\boldsymbol{d}$ | $\ldots$ | $\boldsymbol{d}$ | $\boldsymbol{d}+\boldsymbol{1}$ | $\ldots$ | $\ldots$ |
| $\ldots$ | $\ldots$ |  |  |  |  |
| $\boldsymbol{d}$ |  | $\boldsymbol{d}$ | $d$ |  |  |
| $\boldsymbol{d}+\boldsymbol{1}$ |  | $d$ | $\boldsymbol{d}+\mathbf{1}$ |  |  |
| $\ldots$ |  | $d$ | $d+1$ | $\ldots$ |  |
| $\ldots$ |  | $d$ | $d+1$ |  | $\ldots$ |

## Proof.

- $\sigma_{d}(2 d)=\sigma_{d}(2 d+1)=d$.
- $n>2 d$, smaller than the diagonal value.

## Theorem 4

## Theorem 4

For all $d \geq 2$, if $\sigma_{d}(2 d)=\sigma_{d}(2 d+1)$, then
(1) $\sigma_{d}(n) \leq n-d$ for all $n \geq d \geq 2$
(2) $\sigma_{d}(n) \leq n-d-1$ for all $n>2 d \geq 4$

| d | $\boldsymbol{n}$-d |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | ... | d-1 | d | ... | ... |
|  | ... | $\ldots$ |  |  |  |  |
|  | d-1 |  | $\sigma_{d-1}(2 d-2)$ | $\sigma_{d-1}(2 d-1)$ | $\} \leq 1$ |  |
|  | d |  |  | $\sigma_{d}(2 d)$ |  |  |
|  | ... |  |  |  | $\ldots$ |  |
|  | ... |  |  |  |  | $\ldots$ |

## Proof.

To show $\sigma_{d}(2 d)=\sigma_{d}(2 d+1)=d$. $d$ is the least s.t. $\sigma_{d}(2 d)>d$. $\sigma_{d}(2 d)-\sigma_{d-1}(2 d-1) \leq 1$, and $\sigma_{d-1}(2 d-1)=d-1$. Thus $\sigma_{d}(2 d) \leq d$.

## Outline

(1) Introduction
(2) $(d, n-d)$ Table
(3) Conjecture Reformulations
(4) Relatively Short Square-Maximal Strings Structure
(5) Conclusions

## Relatively Short Square-Maximal Strings Structure

- We investigate the structure of square-maximal strings on the main diagonal.
- If $\sigma_{d}(2 d)=d$ then at least one of the square maximal string is in the form of aabbccddeeff...
- If $\sigma_{d}(2 d)>d$ then the square maximal string is a counterexample. We investigate its structure and draw conclusions for counterexamples with $n \leq 4 d$.

A. Deza, F. Franek and M. Jiang

A d-step Approach for Distinct Squares in Strings

## Pairs

## Lemma 1

Let $d$ is the least s.t. for some $x, s(x)=\sigma_{d}(2 d)>d$. Then $x$ does not contain a pair.

## Proof.

The pair: $x\left[i_{0}\right]=x\left[i_{1}\right]=C$.

- Occurs in only one square. Replace the first $C$ with a new symbol $\hat{C}$.
$d-1 \geq \sigma_{d+1}(2 d) \geq \sigma_{d}(2 d)-1$.
- Occurs in a non-trivial run uvCwuvCwu. Remove wuv between C's.
$d-k \geq \sigma_{d}(2 d-k) \geq \sigma_{d}(2 d)-k$, where $k=|w|+|u|+|v|$.

## Triples

## Lemma 2

Let $d$ is the least s.t. for some $x, s(x)=\sigma_{d}(2 d)>d$. Then $x$ can only contain a triple $x\left[i_{0}\right]=x\left[i_{1}\right]=x\left[i_{2}\right]=C$ that satisfies:
(1) $x\left[i_{0}\right]$ and $x\left[i_{1}\right]$ occur in a run $r_{1}=u_{1} v_{1} C w_{1} u_{1} v_{1} C w_{1} u_{1}$, where $\left|u_{1}\right| \geq 1$,
(2) $x\left[i_{1}\right]$ and $x\left[i_{2}\right]$ occur in a run $r_{2}=u_{2} v_{2} C w_{2} u_{2} v_{2} C w_{2} u_{2}$, where $\left|u_{2}\right| \geq 1$, and where $i_{1}-i_{0} \neq i_{2}-i_{1}$,
(3) either $u_{1} v_{1}$ is a proper suffix of $u_{2} v_{2}$, or $w_{2} u_{2}$ is a proper prefix of $w_{1} u_{1}$.

## Triples (cont.)

## Proof.

$$
\begin{array}{ll}
r_{1}: & u_{1} v_{1} C w_{1} u_{1} v_{1} C w_{1} u_{1} \\
r_{2}: & u_{2} v_{2} C w_{2} u_{2} v_{2} C w_{2} u_{2}
\end{array}
$$

- Show it is impossible to have only two symbols occur in a run.
- Show it is impossible to have three symbols occur in the same run.
- Show it is impossible to have both ends are "long".

## Singletons Estimation

## Lemma 3

Let $d$ is the least s.t. for some $x, s(x)=\sigma_{d}(2 d)>d$. Then $x$ has at least $\left\lceil\frac{2 d}{3}\right\rceil$ singletons.

## Proof.

- Let $u_{1} v_{1}$ is a proper suffix of $u_{2} v_{2}, a=u_{1}[0]$. a occurs at least 6 times in the $r_{1}$ and $r_{2}$. We assign 5 a's to the triple. It can be shown this assignment is mutually disjoint with others.

$$
\begin{array}{lr}
r_{1}: & \dot{u_{1}} \dot{v}_{1} C w_{1} \dot{u}_{1} \dot{v}_{1} C w_{1} u_{1} \\
r_{2}: & u_{2} v_{2} C w_{2} u_{2} v_{2} C w_{2} u_{2}
\end{array}
$$

- $m_{0}$ : the number of triples, $m_{1}$ : the number of other multiply occurring symbols (at least 4 times), $m_{2}$ : the number of singletons.

$$
\begin{align*}
& 2 d \geq 8 m_{0}+4 m_{1}+m_{2}  \tag{1}\\
& d \leq 2 m_{0}+m_{1}+m_{2} \tag{2}
\end{align*}
$$

Thus, $m_{2} \geq\left\lceil\frac{2 d}{3}\right\rceil$

## Theorem 5

## Theorem 5

For all $n \geq d \geq 2, \sigma_{d}(n) \leq n-d \Longleftrightarrow \sigma_{d}(4 d) \leq 3 d$ for all $d \geq 2$

|  | $\boldsymbol{n}$-d |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | ... | $\cdots$ | ... | ... | d | ... | ... |
|  | .. |  |  |  |  | $\cdots$ |  |  |
|  | ... |  |  |  |  | $\sigma_{d^{\prime}}\left(4 d^{\prime}\right)$ | 4 |  |
| $d$ | ... |  |  |  |  | ... | $\left\lceil\frac{2 d}{3}\right\rceil$ |  |
|  | ... |  |  |  |  | ... |  |  |
|  | d |  |  |  |  | $\sigma_{d}(2 d)$ |  |  |
|  | ... |  |  |  |  |  |  |  |
|  | $\cdots$ |  |  |  |  |  |  |  |

## Proof.

$d$ is the least s.t. $\sigma_{d}(2 d)>d$. Remove $\left\lceil\frac{2 d}{3}\right\rceil$ singletons.
$\sigma_{d^{\prime}}\left(4 d^{\prime}\right) \geq \sigma_{d}(2 d)>d$ and $3 d^{\prime}=d$. Thus, $\sigma_{d^{\prime}}\left(4 d^{\prime}\right)>3 d^{\prime}$.

## Theorem 5 (cont.)

- We construct $(d, n-3 d)$ table, the conjectured upper bound is true if all the main diagonal entries satisfies $\sigma_{d}(4 d) \leq 3 d$.

| $n$-3d |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 | 2 | 3 | 4 | $\ldots$ | $d$ | $\ldots$ |  |
| 1 | $\sigma_{1}(4)$ |  |  |  |  |  |  |  |
| 2 |  | $\sigma_{2}(8)$ |  |  |  |  |  |  |
| 3 |  |  | $\sigma_{3}(12)$ |  |  |  |  |  |
| 4 |  |  |  | $\sigma_{4}(16)$ |  |  |  |  |
| $\ldots$ |  |  |  |  | $\ldots$ |  |  |  |
| $d$ |  |  |  |  |  | $\sigma_{d}(4 d)$ |  |  |
| $\ldots$ |  |  |  |  |  |  | $\ldots$ |  |

- In general term, $(d, n-k d)$ table may be constructed and the conjecture is equivalent with $\sigma_{d}((k+1) d) \leq k d$ for all $d \geq 2$ on the main diagonal .

## Outline

(3) Conjecture Reformulations

4 Relatively Short Square-Maximal Strings Structure
(5) Conclusions
A. Deza, F. Franek and M. Jiang

A d-step Approach for Distinct Squares in Strings

## Conclusions

- We exhibit the usefulness of investigating the main diagonal of ( $d, n-d$ ) table for tackling the conjectured upper bound.
- To prove the conjecture by showing that the first counterexample has an impossible structure. i.e. it cannot contain an $k$-tuple, or if it contains an $k$-tuple, then it must contain another symbol with a frequency $>k$.
- To disprove the conjecture by finding a counterexample on the diagonal.
- The Hirsch conjecture was recently disproved by Santos by exhibiting a violation on the diagonal with $d=20$.
- Let's remark the techniques we used for "pushing up" the main diagonal can be applicable to the verification of the conjectured upper bound.
